Лабораторная работа #2

Дисциплина: "Функциональное программирование"

Дата: 2021/10

Выполнил: Федоров Сергей, P34113

Название: "Реализация структуры данных. Property-based testing"

Цель работы: освоиться с построением пользовательских типов данных, полиморфизмом, рекурсивными алгоритмами и средствами тестирования (unit testing, property-based testing).

Вариант:

ЯП	Clojure
Структура	Open addressing Hash-Map

Требования:

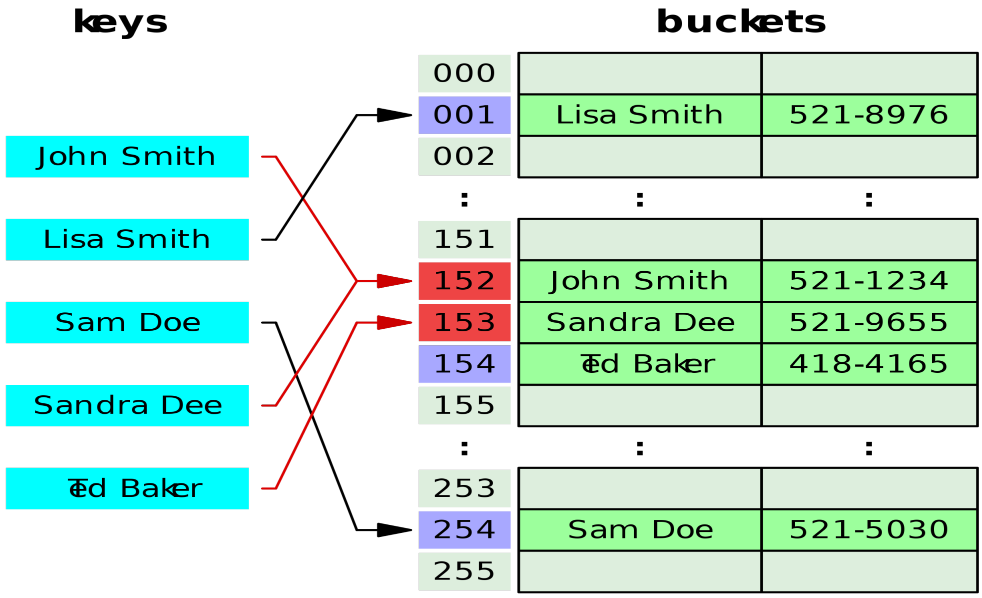
1. Функции:
   - добавление и удаление элементов;
   - фильтрация;
   - отображение (map);
   - свертки (левая и правая);
   - структура должна быть моноидом.
2. Структуры данных должны быть неизменяемыми. Если язык допускает изменение данных – необходимо это протестировать.
3. Реализованные функции должны быть встроены/совместимы со стандартными интерфейсами/библиотекой.
4. Библиотека должна быть протестирована в рамках unit testing.
5. Библиотека должна быть протестирована в рамках property-based тестирования (как минимум 3 свойства).
6. Структура должна быть полиморфной.
7. Требуется использовать идиоматичный для технологии стиль программирования.

Выполнение

Ссылка на репозиторий

Структура данных

Hash-Map с открытой адресацией. Отличие от *"стандартной"* реализации, заключается в механизме разрешения коллизий. Вместо выстраивания цепочек после перехода по хешу, мы продолжаем делать *хопы* помощью "смежных" хэш функций, пока не найдем свободное место.



Программная реализация

Структура проекта:

```
.
├── project.clj
├── src
│    └── functional_programming_itmo_2021
│        └── lab_2
│            ├── main.clj
│            └── hash-map.clj
│            └── src
└── test
     └── functional_programming_itmo_2021
         └── lab_2

             ├── map-unit-testing.clj
             └── map-property-testing.clj
```

Настройка Clojure-окружения с помощью Leiningen:

project.clj

```
(defproject functional-programming-itmo-2021 "0.0.1"
            :description "FIXME: write description"
            :url "http://example.com/FIXME"
            :dependencies [[org.clojure/clojure "1.10.1"]
                           [nrepl/lein-nrepl "0.3.2"]]
            :profiles {
                       :lab_1 {
                               :repl-options {
                                              :init-ns functional-programming-i
                                              :package functional-programming-i
                                              }
                               :main functional-programming-itmo-2021.lab-1.mai
                               }
                       :lab_2 {
                               :repl-options {
                                              :init-ns functional-programming-i
```

```
                                        :init-ns functional-programming-i
                                        :package functional-programming-i
                                        }
                            :main functional-programming-itmo-2021.lab-2.mai
                            }
                      }
              )
```

Имплементация Hash-Map:

hash-map.clj

```
